Empowering DevSecOps with Application Assessment for the Modern World

Discover security holes in even the most complex applications.

- Know Your Weak Points
- Prioritize What Matters Most
- Improve Your Position

While today's malicious attackers pursue a variety of goals, they share a preferred channel of attack—the millions of custom web, mobile, and cloud applications companies deploy to serve their customers. AppSpider dynamically assesses these applications for vulnerabilities across all modern technologies, provides tools that speed remediation, and monitors applications for changes. Keep your applications safe and secure—now and moving forward.

KNOW YOUR WEAK POINTS

AppSpider automatically finds vulnerabilities across a wide range of applications—from the relatively simple to the most complex—and it includes unique capabilities and integrations that enable teams to automate more of the security testing program across the entire software development lifecycle (SDLC), from creation through production.

Coverage is the first step to scanner accuracy. Scanners were originally built with a crawl and attack architecture, but crawling doesn't work for web services and other dynamic technologies. AppSpider can still crawl traditional name=value pair formats like HTML, but it also has a [Universal Translator](#) that can interpret the new technologies being used in today's web and mobile applications (AJAX, GWT, REST, JSON, etc.).

With AppSpider, you can:

- Close the coverage gap with our Universal Translator
- Intelligently simulate real world attacks
- Continuously monitor your applications
- Stay authenticated for deep assessment

Web application attacks are the most common source of breaches.

-2018 Verizon Data Breach Investigations Report

PRIORITIZE WHAT MATTERS MOST

AppSpider includes interactive actionable reports that prioritize the highest risk and streamline remediation efforts by enabling users to quickly get to and analyze the data that matters most. With one click, you can drill deep into a vulnerability to get more information and replay attacks in real-time.

Sifting through pages and pages of vulnerabilities in a PDF report takes too much time. AppSpider provides interactive, actionable reports that behave like web pages with intuitive organization and links for deeper analysis. Analysis doesn't have to be tedious: Findings are organized and consolidated by attack types (XSS, SQLi, etc.), and with one click, you can drill deep into a vulnerability to get more information. AppSpider's sophisticated reports reduce remediation time and streamline communication with developers.

With AppSpider, you can:

- Conduct deeper analysis with interactive reports
- Quickly replay web attacks
- Categorize applications for easy reporting

IMPROVE YOUR POSITION

In order to improve your overall security posture, you need a high-level view of your application security program that enables you to see where things stand. AppSpider enables centralized control, automation, and interoperability over all aspects of your enterprise web application security program, including: continuous scanning configuration, user permissions, scheduling, and monitoring. In addition, AppSpider includes trends and analysis data to help collaborate with all stakeholders toward improved security posture.

Time is critical when remediating vulnerabilities. Using innovative automated rule generation, AppSpider's defensive capabilities help security professionals patch web application vulnerabilities almost immediately—in a matter of minutes, instead of days or weeks. Without the need to build a custom rule for a web application firewall (WAF) or intrusion prevention system (IPS), or the need to deliver a source code patch, our software allows you the time to identify the root cause of the problem and fix it in the code.

With AppSpider, you can:

- Manage and control application security programs
- Automate targeted virtual patching
- Meet compliance requirements
- Integrate into your DevSecOps workflow

MAXIMIZE YOUR TECH STACK

You move faster when security moves left in the SDLC. Start by [integrating AppSpider](#) with the tools of your DevOps team.

“AppSpider has good SDLC and enterprise integration capabilities for a DAST solution, including plug-ins with bug-tracking tools, WAF and IPS products.”

- Gartner, 2018 Magic Quadrant for Application Security Testing

MEET COMPLIANCE REQUIREMENTS

Keeping up with industry best practices and legal and regulatory compliance issues is no easy task. AppSpider helps your team quickly see gaps in compliance and well known best practices including: PCI, FISMA, SOX, HIPAA, GLBA, OWASP, and more.
